

Welding Unit 512 3.3 Hz

Capacitor Discharge Welding

Traditional capacitor discharge welding is the right choice for a large number of welding tasks.

The energy of a previously charged capacitor is discharged onto the work piece by way of an impulse transformer.

This results in high welding currents, a high current slope and a short welding time.

The high energy concentration thus limits the zone of heat influence within the component to a small extent.

A large variety of welding tasks may thus be resolved, even including difficult combinations of material.

Characteristic Features

- Maximum welding energy 512 Ws
- Welding time 3, 6 and 9 ms
- Use of a metallized paper capacitor
- Maximum cycles up to 200 welds per minute
- Welding voltage 5 to 8 V
- Cooling by means of air
- Dimensions (H / D / W)
Generator 1340 x 820 480 mm

- Weight
Generator 270 kg
